

Sammy's Games

A Board and Card Game Platform
By Sammy Santos 1/23/26

Project Description

- My project will be an application that allows users to play fun, original games designed by me.
- The target audience: anyone who enjoys playing and learning new games. For example, users of cardgames.io, the NYT games, or GamePigeon.
- Features: simple, intuitive interfaces, quick and accessible gameplay, and the ability to play solo or with friends.

User's point of view

- Game Selection: Users start at the main menu where they can choose games with a simple interface.
- Gameplay: Users will have intuitive mouse and/or keyboard controls, and will be guided to show what moves are legal.
- Outcome: When a game ends, you are shown the outcome (win/loss/draw) and prompted to either play again or return to the main menu.

Why am I interested

- I enjoy playing and designing games, and I have wanted to code some of my games for a while now.
- The challenge level of this project can be flexible, I can focus on one or two games if I'm struggling, or keep implementing more if I'm not. It is unlikely that this project will not be challenging enough.
- Ending my college career with this project feels appropriate because it showcases my skills in design, creativity, and problem-solving. I can also take it further in the future by making AI agents to play my games.

What technologies will I use?

- The application will likely be built using HTML, CSS, and JavaScript, which I have some experience with.
- I currently plan to use GitHub Pages to host it as a web application. I do not have experience with this yet, but that will be part of the challenge.
- GitHub will be used for version control and overall project management and upkeep.
