

Project Proposal

Verbal Description and Justification

Sammy's Games: A Board and Card Game Platform

I plan to develop a software application that allows users to play various simple board and card games that I've created. The purpose of this project is to provide users with a collection of original, easy-to-learn games. There will be a focus on simplicity, entertainment, and replayability.

The application will feature an intuitive interface where you can select a game and immediately play it. Games will typically include clear rules and be as accessible as possible. Depending on the game, you may be able to play solo, with a friend or with the computer. The key features of the project will be a central game hub, fun and accessible gameplay, and the ability to play with friends or the computer.

I was inspired by various existing applications such as cardgames.io and [GamePigeon](https://gamepigeon.com). I had this idea back when I took game design, where I made one of the games I want to code. The intended users of this application are anyone looking for a few minutes of entertainment. Considering the popularity of apps such as Wordle and the New York Times games, there are certainly people looking for fun games to play a few minutes a day. Required hardware and software are just a standard computer or laptop and a modern web browser. The app will be maintained by me, improving and adding new games over time.

This project will apply what I have learned in other classes, such as game design, computer graphics, and artificial intelligence. As I said above, game design is where the idea for this originated. Graphics will be helpful for rendering game elements, and artificial intelligence could be useful if time allows for me to develop strong computer opponents. The technical difficulty and time constraints will be appropriate, as this project can be flexible in terms of how many games I can implement. If it turns out to be very difficult, I can focus on just one game, if not I can try my hand at multiple. I should have the tools necessary to complete the project. To start I will try to use GitHub Pages, but I will try various other ways if I get stuck. The project will be interesting to me because I enjoy designing and playing games, and hopefully it will be interesting to classmates and the instructor for similar reasons as well.
